Research Summary

I am a computer systems researcher. Computer systems underpin every modern application that we interact with today. When designing systems, one must often tradeoff strong guarantees for performance or vice-versa. *My goal is to ensure that computer systems enable applications to realize both correctness and high performance.* My research so far has focused on resolving the tension between correctness and performance in distributed storage systems. *My work rethinks fundamental problems to build new distributed storage systems that provide strong consistency and reliability guarantees yet also perform well.*
My vision is to build the next-generation systems for emerging hardware (e.g., smartNICs and smartSSDs) and deployment scenarios (e.g., the edge). In particular, my goal is to ensure that these future systems satisfy the demanding requirements of modern applications while achieving high performance.
